吸收式冰箱制冷原理

Principles of absorption refrigerator

吸收式冰箱是利用-水-氨混合液体在连续吸收-扩散过程中达到制冷的目的。吸收式冰箱系统中，氨作为制冷剂，氨水溶液为吸收剂，氮气为平衡气体。是由机芯底部制冷器内部的氨水，被发热片加热后蒸发，变成氨气上升到顶部的散热片中，自然冷却成氨水后到达冰箱内部的蒸发器与氮气接触，急速氧化吸走热量达到制冷功能。制冷后氨气继续下沉，开始下一次制冷循环。

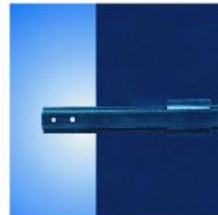

Absorption refrigerator is the principle of ammonia-water-ammonia mixed solution in a continuous absorption-diffusion process to achieve the purpose of cooling. In absorption refrigerator system, ammonia as a refrigerant, ammonia solution as the absorbent, nitrogen as balance gas. The ammonia water from bottom of the cooler was heated by heat film into ammonia gas, then moved to the heat sink, naturally cooled into ammonia water, then entered into the evaporator mixed with ammonia gas, the rapid gasification to take away the heat lead to refrigeration. After refrigeration, the ammonia water continues to sink to reach the bottom of refrigerator, and begin the next refrigeration recycle.
